

Node.js - Express Framework

https://www.tutorialspoint.com/nodejs/nodejs_express_framework.htm

Copyright © tutorialspoint.com

Express Overview

Express is a minimal and flexible Node.js web application framework that provides a robust set of features to develop web and mobile applications. It facilitates the rapid development of Node based Web applications. Following are some of the core features of Express framework –

- Allows to set up middlewares to respond to HTTP Requests.
- Defines a routing table which is used to perform different actions based on HTTP Method and URL.
- Allows to dynamically render HTML Pages based on passing arguments to templates.

Installing Express

Firstly, install the Express framework globally using NPM so that it can be used to create a web application using node terminal.

```
$ npm install express --save
```

The above command saves the installation locally in the **node_modules** directory and creates a directory **express** inside **node_modules**. You should install the following important modules along with **express** –

- **body-parser** – This is a node.js middleware for handling JSON, Raw, Text and URL encoded form data.
- **cookie-parser** – Parse Cookie header and populate **req.cookies** with an object keyed by the cookie names.
- **multer** – This is a node.js middleware for handling multipart/form-data.

```
$ npm install body-parser --save  
$ npm install cookie-parser --save  
$ npm install multer --save
```

Hello world Example

Following is a very basic Express app which starts a server and listens on port 3000 for connection. This app responds with **Hello World!** for requests to the homepage. For every other path, it will respond with a **404 Not Found**.

```
var express = require('express');  
var app = express();  
  
app.get('/', function (req, res) {  
  res.send('Hello World');  
})  
  
var server = app.listen(8081, function () {  
  var host = server.address().address  
  var port = server.address().port
```

```
console.log("Example app listening at http://%s:%s", host, port)
})
```

Save the above code in a file named `server.js` and run it with the following command.

```
$ node server.js
```

You will see the following output –

```
Example app listening at http://0.0.0.0:8081
```

Open `http://127.0.0.1:8081/` in any browser to see the following result.

Request & Response

Express application uses a callback function whose parameters are **request** and **response** objects.

```
app.get('/', function (req, res) {
  // --
})
```

- [Request Object](#) – The request object represents the HTTP request and has properties for the request query string, parameters, body, HTTP headers, and so on.
- [Response Object](#) – The response object represents the HTTP response that an Express app sends when it gets an HTTP request.

You can print **req** and **res** objects which provide a lot of information related to HTTP request and response including cookies, sessions, URL, etc.

Basic Routing

We have seen a basic application which serves HTTP request for the homepage. Routing refers to determining how an application responds to a client request to a particular endpoint, which is a URI (or path) and a specific HTTP request method (GET, POST, and so on).

We will extend our Hello World program to handle more types of HTTP requests.

```
var express = require('express');
var app = express();
```

```
// This responds with "Hello World" on the homepage
app.get('/', function (req, res) {
  console.log("Got a GET request for the homepage");
  res.send('Hello GET');
})

// This responds a POST request for the homepage
app.post('/', function (req, res) {
  console.log("Got a POST request for the homepage");
  res.send('Hello POST');
})

// This responds a DELETE request for the /del_user page.
app.delete('/del_user', function (req, res) {
  console.log("Got a DELETE request for /del_user");
  res.send('Hello DELETE');
})

// This responds a GET request for the /list_user page.
app.get('/list_user', function (req, res) {
  console.log("Got a GET request for /list_user");
  res.send('Page Listing');
})

// This responds a GET request for abcd, abxcd, ab123cd, and so on
app.get('/ab*cd', function (req, res) {
  console.log("Got a GET request for /ab*cd");
  res.send('Page Pattern Match');
})

var server = app.listen(8081, function () {

  var host = server.address().address
  var port = server.address().port

  console.log("Example app listening at http://%s:%s", host, port)
})
```

Save the above code in a file named server.js and run it with the following command.

```
$ node server.js
```

You will see the following output –

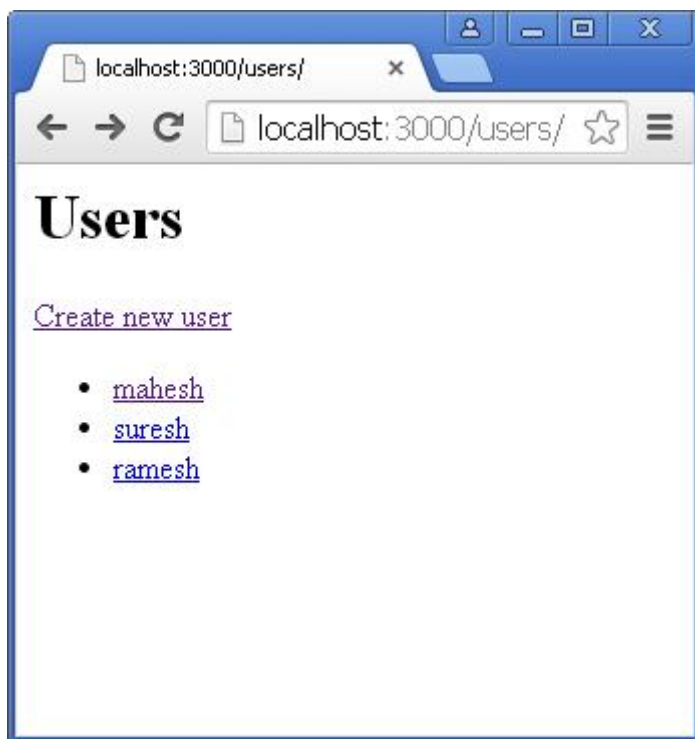

```
Example app listening at http://0.0.0.0:8081
```

Now you can try different requests at <http://127.0.0.1:8081> to see the output generated by server.js. Following are a few screenshots showing different responses for different URLs.

Screen showing again http://127.0.0.1:8081/list_user

Screen showing again <http://127.0.0.1:8081/abcd>

Screen showing again <http://127.0.0.1:8081/abcdefg>

Serving Static Files

Express provides a built-in middleware **express.static** to serve static files, such as images, CSS, JavaScript, etc.

You simply need to pass the name of the directory where you keep your static assets, to the **express.static** middleware to start serving the files directly. For example, if you keep your images, CSS, and JavaScript files in a directory named **public**, you can do this –

```
app.use(express.static('public'));
```

We will keep a few images in **public/images** sub-directory as follows –

```
node_modules
server.js
public/
public/images
public/images/logo.png
```

Let's modify "Hello Word" app to add the functionality to handle static files.

```
var express = require('express');
var app = express();

app.use(express.static('public'));

app.get('/', function (req, res) {
  res.send('Hello World');
})

var server = app.listen(8081, function () {
  var host = server.address().address
  var port = server.address().port

  console.log("Example app listening at http://%s:%s", host, port)
})
```

Save the above code in a file named **server.js** and run it with the following command.

```
$ node server.js
```

Now open <http://127.0.0.1:8081/images/logo.png> in any browser and see observe following result.

GET Method

Here is a simple example which passes two values using HTML FORM GET method. We are going to use **process_get** router inside server.js to handle this input.

```
<html>
  <body>

    <form action = "http://127.0.0.1:8081/process_get" method = "GET">
      First Name: <input type = "text" name = "first_name"> <br>
      Last Name: <input type = "text" name = "last_name">
      <input type = "submit" value = "Submit">
    </form>

  </body>
</html>
```

Let's save above code in index.htm and modify server.js to handle home page requests as well as the input sent by the HTML form.

```
var express = require('express');
var app = express();

app.use(express.static('public'));
app.get('/index.htm', function (req, res) {
  res.sendFile( __dirname + "/" + "index.htm" );
})

app.get('/process_get', function (req, res) {
  // Prepare output in JSON format
  response = {
    first_name:req.query.first_name,
    last_name:req.query.last_name
  };
  console.log(response);
  res.end(JSON.stringify(response));
})

var server = app.listen(8081, function () {
  var host = server.address().address
  var port = server.address().port
  console.log("Example app listening at http://%s:%s", host, port)
})
```

Accessing the HTML document using *http://127.0.0.1:8081/index.htm* will generate the following form –

First Name:

Last Name:

Now you can enter the First and Last Name and then click submit button to see the result and it should return the following result –

```
{"first_name":"John","last_name":"Paul"}
```

POST Method

Here is a simple example which passes two values using HTML FORM POST method. We are going to use **process_get** router inside server.js to handle this input.

```
<html>
  <body>

    <form action = "http://127.0.0.1:8081/process_post" method = "POST">
      First Name: <input type = "text" name = "first_name"> <br>
      Last Name: <input type = "text" name = "last_name">
      <input type = "submit" value = "Submit">
    </form>

  </body>
</html>
```

Let's save the above code in index.htm and modify server.js to handle home page requests as well as the input sent by the HTML form.

```
var express = require('express');
var app = express();
var bodyParser = require('body-parser');

// Create application/x-www-form-urlencoded parser
var urlencodedParser = bodyParser.urlencoded({ extended: false })

app.use(express.static('public'));
app.get('/index.htm', function (req, res) {
  res.sendFile( __dirname + "/" + "index.htm" );
})

app.post('/process_post', urlencodedParser, function (req, res) {
  // Prepare output in JSON format
  response = {
    first_name:req.body.first_name,
    last_name:req.body.last_name
  };
  console.log(response);
  res.end(JSON.stringify(response));
})

var server = app.listen(8081, function () {
  var host = server.address().address
  var port = server.address().port

  console.log("Example app listening at http://%s:%s", host, port)
})
```

Accessing the HTML document using *http://127.0.0.1:8081/index.htm* will generate the following form –

First Name:

Last Name:

Now you can enter the First and Last Name and then click the submit button to see the following result –

```
{"first_name":"John","last_name":"Paul"}
```

File Upload

The following HTML code creates a file uploader form. This form has method attribute set to **POST** and enctype attribute is set to **multipart/form-data**

```
<html>
  <head>
    <title>File Uploading Form</title>
  </head>

  <body>
    <h3>File Upload:</h3>
    Select a file to upload: <br />

    <form action = "http://127.0.0.1:8081/file_upload" method = "POST"
      enctype = "multipart/form-data">
      <input type="file" name="file" size="50" />
      <br />
      <input type = "submit" value = "Upload File" />
    </form>

  </body>
</html>
```

Let's save above code in index.htm and modify server.js to handle home page requests as well as file upload.

```
var express = require('express');
var app = express();
var fs = require("fs");

var bodyParser = require('body-parser');
var multer = require('multer');

app.use(express.static('public'));
app.use(bodyParser.urlencoded({ extended: false }));
app.use(multer({ dest: '/tmp/' }));

app.get('/index.htm', function (req, res) {
  res.sendFile( __dirname + "/" + "index.htm" );
})

app.post('/file_upload', function (req, res) {
  console.log(req.files.file.name);
  console.log(req.files.file.path);
  console.log(req.files.file.type);
  var file = __dirname + "/" + req.files.file.name;

  fs.readFile( req.files.file.path, function (err, data) {
    fs.writeFile(file, data, function (err) {
      if( err ){
        console.log( err );
      }
    });
  });
});
```

```

        }else{
            response = {
                message:'File uploaded successfully',
                filename:req.files.file.name
            };
        }
        console.log( response );
        res.end( JSON.stringify( response ) );
    });
});
})

var server = app.listen(8081, function () {
    var host = server.address().address
    var port = server.address().port

    console.log("Example app listening at http://%s:%s", host, port)
})

```

Accessing the HTML document using *http://127.0.0.1:8081/index.htm* will generate the following form –

File Upload:

Select a file to upload:

No file chosen

NOTE: This is just dummy form and would not work, but it must work at your server.

Cookies Management

You can send cookies to a Node.js server which can handle the same using the following middleware option. Following is a simple example to print all the cookies sent by the client.

```

var express      = require('express')
var cookieParser = require('cookie-parser')

var app = express()
app.use(cookieParser())

app.get('/', function(req, res) {
    console.log("Cookies: ", req.cookies)
})
app.listen(8081)

```
